EXPERIENCE

Software Engineer, Platform Engineering TCW Group

January 2023 – Present
New York, NY

- Created the frontend for an AI document analysis system in React/TypeScript, which enabled users to write reusable rule sets and evaluate uploaded PDFs against them, allowing for automated analysis of documents greater than 600 pages to be completed in less than one minute.
- Implemented a real-time job monitoring view using Server-Sent Events, streaming live document processing status, with a searchable history of completed documents giving users insight into all requests.
- Designed a view giving users access to the results of processed documents, including rule compliance charts and an interactive PDF viewer with text highlighting and navigation, built using react-pdf and the Aho-Corasick pattern matching algorithm to find the exact text that AI flagged, along with information on the LLM's reasoning and confidence levels.
- Scaled TCW's self-service developer platform from 2 to 10 tech stacks, provisioning production-ready GitLab repositories with templated code generation, standardized CI/CD pipelines, deployment configuration and shared helper libraries.
- Established the platform as the standard provisioning path for all new services across the technology organization, replacing a 35-minute manual setup with a 20-second automated request.
- Built a frontend for automated provisioning of Key Vault and AMQP messaging resources with a full approval workflow, role-based administration and email notifications, eliminating 40 manual tickets per month, along with an end-to-end request tracking system for both administrators and users.
- Developed Go (Fiber) microservices with the security team to automate Snowflake account provisioning, replacing manual account creation and approval with a self-service flow.
- Automated Okta application registration, including sAMAccountName lookup for authorization management, working with the security team to eliminate 10 manual IAM configuration tickets per month.
- Wrote shared React components with custom styling and Vitest coverage for the organization-wide frontend monorepo established by my team, standardizing UI patterns across four engineering teams.
- Delivered a recurring technical talk series to groups ranging from 40 to 70 engineers on Green Programming, Git/GitLab workflows, and automated CI/CD, which increased org-wide adoption of Platform Engineering's developer automation tools.

Platform Engineering Intern TCW Group

June 2022 – December 2022
Los Angeles, CA

- Founding engineer on TCW's internal developer platform, building the React/TypeScript web application from scratch, designing the UI/UX using Figma, and building the application shell, navigation and request forms for the React and .NET templated repository requests.
- Delivered self-service repository provisioning which generated boilerplate code, project configuration and deployment pipelines built from user input, giving developers production-ready repositories in under 20 seconds without any manual setup.
- Extended the .NET service which interfaced with the GitLab API, created the repositories and generated all of the code to support the React and .NET requests, along with increasing the unit test coverage to 80% before rolling out the platform.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Go, C#, HTML/CSS

Frontend: React, Material UI, Ant Design, react-pdf, react-chartjs-2, custom CSS

Backend & Tooling: Go (Fiber), .NET, GitLab CI/CD, Git, Vitest, Figma

EDUCATION

New York University
Bachelor of Arts in Computer Science

December 2022
New York, NY
